
2.1.3 now available.

Posted by fabrizim - 2008/02/06 21:41

Hello everyone-

Since 2.1.2, we have had several support requests and provided bug fixes either on individual installations, or in 2.1.3 beta builds. We are happy to announce that these fixes, along with a few new features, have been packaged for the 2.1.3 release.

Features

Improved usability in the wizard. New input types for the size and date fields (Example)sh404SEF compatibility. Remove "Meal select" if not needed Smart Party Size options, limits maximum available option to number of seats at largest table in restaurant.

Bug Fixes

Changed some database schemas for better mysql version compatibility Better Joomfish integration Minor CSS changes for the wizard Fixed a bug with phpmailer that prevented CCs on emails from working. Fixed a problem with attaching reports to notification emails.

Additionally, we have taken some of the code from the component and packaged it into separate plugins. This was mainly for code maintenance reasons. These plugins are dynamically downloaded and installed when installing the component. This helps to make the size of the installer more manageable and will increase the performance of your next update. Should you encounter any problems on install, please contact us via the forum, and we will look into it right away.

Best Regards-

Mark Jr.
