## Upstairs/Downstairs

Posted by Wayne John Stephenson - 2008/02/22 09:40

---

I am very intersted in this component for a client of mine. They have a restaurant on two levels (upstairs and downstairs). Is it possible with table boss to have two views or can you reccomend an easy way to differentiate the tables that are upstairs from the tables that are downstairs.

This looks like a fantastic component and would love to see some real time installations where this has been put into use.

Kindest Regards and keep up the hard work.

Wayne:cheer:

Wayne,

Thanks for your interest in TableBoss and the compliment.

Adding multiple 'rooms' is an enhancement we have on our roadmap, however we can not commit to a timeframe.

A naming convention for the tables may be the best way to workaround it now. The wizard however would not be able to distinguish between the 'rooms' during auto-assignment without some modification.

To respect our customer's anonymity from test reservations, I will send you a short list of websites by private e-mail shortly.

Mark

Mark...

Wayne brings up my next request and I am happy to see you have it on your roadmap. In the instance of my client they have 5 separate areas and it would be nice to toggle between screens.

Good recommend about the naming convention.

Wayne if you like you could browse the site I am building for a client right now <http://reso.gooru.ca>
