## Reservation for multiple resataurants

Posted by Tdesigner - 2008/12/17 05:08

---

Hi:

I am working on a site which is a list of restaurants. The idea is to be able to make reservations on any of these restaurants from our site. So the question is naturally whether TableBoss can be used in such way, either by copying the module as many times as possible or via any other workaround.

Thanks!

TableBoss is not a directory solution. A Joomla installation and a TableBoss license is required for each restaurant definition.

You could use subdomains like, rest1.myportal.com, rest2.myportal.com, rest3.myportal.com, etc. for example. Each a Joomla install and each with a TB License. We do offer volume discounts when TB licenses are sold in bundles.
